Brainstorming web pages

I thought I would brainstorm out several pages that seem likely for the Somnium application.

- Home
  - / or /home
  - No authentication required
  - Links to login and add account
- Login
  - /login
  - User lands here when they try to navigate to any page when they are not authenticated or they are not authorized
- Admin
  - /admin
  - Only authenticated users with admin privileges are allowed
  - Charity Management
    - /charity
    - CRUD operations

I will stop here for now as we need to agree on several issues before moving on to user management, reporting, etc, etc.

- How will we authenticate a user?
- How will we set permissions? Either admin or user? More granular?
- Can we design a set of generic screens for CRUD operations that can be used for charies, users, etc? Initially wire frames would be good. These wire frames will let us all know how to add a <fill in the blank>, delete, list, search, etc.
- No financial application is complete without detailed logging. Do we log every request and response. Do we log every unauthorized action?
